① BACKGROUND

② PROBLEM

③ SOLUTION

④ EXPERIMENTS

⑤ CONCLUSION

# Strategic Behavior Prediction: Introduction

- **Strategic behavior:** Human behavior in strategic environments:
  - Bidding in auctions.
  - Offering in bargainings.
  - Actions in card/board games.

# Strategic Behavior Prediction: Conventional Approach

- **Game theory approach**
  - **Steps:** (i) equilibrium assumption; (ii) predict behavior using game theory models.

# Strategic Behavior Prediction: Conventional Approach

- **Game theory approach**
  - **Steps:** (i) equilibrium assumption; (ii) predict behavior using game theory models.
  - **Cons:** (i) strong assumptions; (ii) inaccurate prediction.

# Strategic Behavior Prediction: Conventional Approach

- **Game theory approach**
  - **Steps:** (i) equilibrium assumption; (ii) predict behavior using game theory models.
  - **Cons:** (i) strong assumptions; (ii) inaccurate prediction.
- **Machine learning approach**
  - **Steps:** (i) train machine learning models on historical behavior data; (ii) predict behavior with the trained models.

# Strategic Behavior Prediction: Conventional Approach

- **Game theory approach**
  - **Steps:** (i) equilibrium assumption; (ii) predict behavior using game theory models.
  - **Cons:** (i) strong assumptions; (ii) inaccurate prediction.
- **Machine learning approach**
  - **Steps:** (i) train machine learning models on historical behavior data; (ii) predict behavior with the trained models.
  - **Pros:** (i) fewer assumptions (ii) accurate prediction.

$$\text{Output} = f(\text{Input})$$

Glauner et al. (2018)

## Strategic Behavior Prediction: Motivation

- Due to bounded rationalities, a **gap** exists between the game-theoretic prediction and real human behavior.

Game theory model

Human behavior

## Strategic Behavior Prediction: Motivation

- Due to bounded rationalities, a **gap** exists between the game-theoretic prediction and real human behavior.
  - The gap can be highly correlated with the strategic environment.

Game theory model

Strategic environment

Human behavior

## Strategic Behavior Prediction: Motivation

- Due to bounded rationalities, a **gap** exists between the game-theoretic prediction and real human behavior.
  - The gap can be highly correlated with the strategic environment.

- To bridge the gap:
  - Take the game theory models as source of *domain knowledge*.

## Strategic Behavior Prediction: Motivation

- Due to bounded rationalities, a **gap** exists between the game-theoretic prediction and real human behavior.
  - The gap can be highly correlated with the strategic environment.

- To bridge the gap:
  - Take the game theory models as source of *domain knowledge*.
  - Use machine learning to learn the **mapping** from the domain knowledge and strategic environment to real human behavior.

  - $d$ : bid increment

# Penny Auction

- In penny auctions:
  - $q$ : buying price
  - $b$ : bid fee
  - $d$ : bid increment

# Penny Auction

- In penny auctions:
  - $q$ : buying price
  - $b$ : bid fee
  - $d$ : bid increment
  - $n$ : duration

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Duration is important because it relates to:

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Duration is important because it relates to:
  - buying price (e.g.,  $4 \cdot d$ )

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Duration is important because it relates to:
  - buying price (e.g.,  $4 \cdot d$ )
  - overall payment (e.g.,  $4 \cdot b + 4 \cdot d$ )

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Duration is important because it relates to:
  - buying price (e.g.,  $4 \cdot d$ )
  - overall payment (e.g.,  $4 \cdot b + 4 \cdot d$ )
  - **strategic behavior**

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Duration is important because it relates to:
  - buying price (e.g.,  $4 \cdot d$ )
  - overall payment (e.g.,  $4 \cdot b + 4 \cdot d$ )
  - **strategic behavior**
    - Bidders choose between *bidding* or *not bidding*.

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Duration is important because it relates to:
  - buying price (e.g.,  $4 \cdot d$ )
  - overall payment (e.g.,  $4 \cdot b + 4 \cdot d$ )
  - **strategic behavior**
    - Bidders choose between *bidding* or *not bidding*.
    - Duration is the result of bidders' strategic behavior.

# Problem Formulation

- **Auction configuration:** Penny auctions are categorized by the configuration  $s_i = \{r_i, v_i, b_i, d_i\}, s_i \in \mathcal{S}$ .
  - $i$ : data index
  - $b_i$ : bid fee
  - $d_i$ : bid increment

# Problem Formulation

- **Auction configuration:** Penny auctions are categorized by the configuration  $s_i = \{r_i, v_i, b_i, d_i\}, s_i \in \mathcal{S}$ .
  - $i$ : data index
  - $b_i$ : bid fee
  - $d_i$ : bid increment
  - $r_i$ : product (e.g., “Apple iPhone 3G 16GB (White)”)
  - $v_i$ : retail price (e.g., “\$699”)

# Problem Formulation

- **Auction configuration:** Penny auctions are categorized by the configuration  $s_i = \{r_i, v_i, b_i, d_i\}, s_i \in \mathcal{S}$ .
  - $i$ : data index
  - $b_i$ : bid fee
  - $d_i$ : bid increment
  - $r_i$ : product (e.g., “Apple iPhone 3G 16GB (White)”)
  - $v_i$ : retail price (e.g., “\$699”)
  - $\mathcal{S}$ : the set of all auction configurations

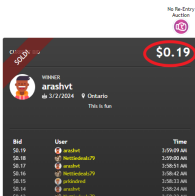

# Duration in Penny Auction

- **What we want to predict:** DURATION.

# Duration in Penny Auction

- **What we want to predict:** DURATION.
- Penny auctions with the same configuration.

Reign Olympia - Blue / Silver  
Buy It Now price: \$700

Reign Olympia - Blue / Silver  
Buy It Now price: \$700

## Problem Formulation

- **Auction configuration:** Penny auctions are categorized by the configuration  $s_i = \{r_i, v_i, b_i, d_i\}, s_i \in \mathcal{S}$ .
  - $i$ : data index
  - $b_i$ : bid fee
  - $d_i$ : bid increment
  - $r_i$ : product
  - $v_i$ : retail price
  - $\mathcal{S}$ : the set of all auction configurations
- **Duration distribution:** The probability that an auction ends after  $n$  rounds is  $p_{i,n}$  for each  $s_i \in \mathcal{S}$ .

### Auction Duration Prediction Problem

Given  $s_i$ , how to predict  $p_{i,n}$ .

1 BACKGROUND

2 PROBLEM

**3 SOLUTION**

4 EXPERIMENTS

5 CONCLUSION

# ADAPT

- A three-stage framework: Auction Duration Prediction (ADAPT)
- Integration of game theory and machine learning.

# Stage I: Product Embedding

- $r$ : product (e.g., “Apple iPhone 3G 16GB (White)”).
- The pre-trained Sentence Transformer [Reimers and Gurevych \(2019\)](#) encodes  $r$  into a fixed-length embedding  $e$ .

# Stage I: Product Embedding

- $r$ : product (e.g., “Apple iPhone 3G 16GB (White)”).
- The pre-trained Sentence Transformer [Reimers and Gurevych \(2019\)](#) encodes  $r$  into a fixed-length embedding  $e$ .
- “Context-aware”.

## Stage II: Domain Knowledge Extraction

## Stage II: Domain Knowledge Extraction

- **Domain knowledge:** Distribution prediction  $p_{i,n}$  from different game theory models (e.g., GT1, GT2, ...).
  - $p_{i,n}$ : The probability that an auction ends after  $n$  rounds.

## Stage II: Domain Knowledge Extraction

- **Domain knowledge:** Distribution prediction  $p_{i,n}$  from different game theory models (e.g., GT1, GT2, ...).
  - $p_{i,n}$ : The probability that an auction ends after  $n$  rounds.
- **To obtain  $p_{i,n}$ ,**
  - **When to end:** After  $n$  rounds, no bidder would like to bid.

## Stage II: Domain Knowledge Extraction

- **Domain knowledge:** Distribution prediction  $p_{i,n}$  from different game theory models (e.g., GT1, GT2, ...).
  - $p_{i,n}$ : The probability that an auction ends after  $n$  rounds.
- **To obtain  $p_{i,n}$ ,**
  - **When to end:** After  $n$  rounds, no bidder would like to bid.
  - $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.

## Stage II: Domain Knowledge Extraction

- **Domain knowledge:** Distribution prediction  $p_{i,n}$  from different game theory models (e.g., GT1, GT2, ...).
  - $p_{i,n}$ : The probability that an auction ends after  $n$  rounds.
- **To obtain  $p_{i,n}$ ,**
  - **When to end:** After  $n$  rounds, no bidder would like to bid.
  - $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.

$$p_{i,n} = (1 - u_{i,n+1}) \cdot \prod_{t=1}^n u_{i,t} \quad (1)$$

## Stage II: Domain Knowledge Extraction

- To obtain  $p_{i,n}$ , we need  $u_{i,t}$ :

$$p_{i,n} = (1 - u_{i,n+1}) \cdot \prod_{t=1}^n u_{i,t} \quad (1)$$

- $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.

## Stage II: Domain Knowledge Extraction

- **To obtain**  $p_{i,n}$ , we need  $u_{i,t}$ :

$$p_{i,n} = (1 - u_{i,n+1}) \cdot \prod_{t=1}^n u_{i,t} \quad (1)$$

- $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.
- **To obtain**  $u_{i,t}$ , we turn to game theory models.

## Stage II: Domain Knowledge Extraction

- **To obtain**  $p_{i,n}$ , we need  $u_{i,t}$ :

$$p_{i,n} = (1 - u_{i,n+1}) \cdot \prod_{t=1}^n u_{i,t} \quad (1)$$

- $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.
- **To obtain**  $u_{i,t}$ , we turn to game theory models.
- **Equilibrium condition**: A bidder is indifferent between bidding or not bidding, when these two actions have the same utility.

## Stage II: Domain Knowledge Extraction

- **To obtain**  $p_{i,n}$ , we need  $u_{i,t}$ :

$$p_{i,n} = (1 - u_{i,n+1}) \cdot \prod_{t=1}^n u_{i,t} \quad (1)$$

- $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.
- **To obtain**  $u_{i,t}$ , we turn to game theory models.
- **Equilibrium condition**: A bidder is indifferent between bidding or not bidding, when these two actions have the same utility.
- **Example: game theory model based on Expected Utility Theory (EUT)**:

## Stage II: Domain Knowledge Extraction

- To obtain  $p_{i,n}$ , we need  $u_{i,t}$ :

$$p_{i,n} = (1 - u_{i,n+1}) \cdot \prod_{t=1}^n u_{i,t} \quad (1)$$

- $u_{i,t}$ : The probability that at least one bidder bids after  $t - 1$  rounds.
- To obtain  $u_{i,t}$ , we turn to game theory models.
- **Equilibrium condition**: A bidder is indifferent between bidding or not bidding, when these two actions have the same utility.
- **Example: game theory model based on Expected Utility Theory (EUT)**:

$$\underbrace{(1 - u_{i,t}) \cdot (v_i - (t - 1) \cdot d_i - b_i)}_{\text{Bidding and winning}} + \underbrace{u_{i,t} \cdot (-b_i)}_{\text{Bidding and losing}} = \underbrace{0}_{\text{Not bidding}} \quad (2)$$

- $v_i$ : retail price
- $b_i$ : bid fee
- $d_i$ : bid increment

## Stage III: Duration Distribution Prediction

- **Multi-Branch MDN: Multi-Branch Mixture Density Network.**
  - Input: Output from Stage I and Stage II.

## Stage III: Duration Distribution Prediction

- **Multi-Branch MDN: Multi-Branch Mixture Density Network.**
  - Input: Output from Stage I and Stage II.
  - Output: Prediction of the auction duration distribution.
    - Mixture density network [Bishop \(1994\)](#) is able to output a distribution.

## Stage III: Duration Distribution Prediction

- **Loss function:** Negative log-likelihood.

$$\text{Loss}_{\text{MB-MDN}} = - \sum_{i: |\mathcal{N}_i| \neq 0} \frac{1}{|\mathcal{N}_i|} \sum_{n \in \mathcal{N}_i} \log(\hat{p}_{i,n}), \quad (3)$$

- $n$ : actual auction duration.
- $i$ : index.
- $\hat{p}_{i,n}$ : prediction from ADAPT.
- $\mathcal{N}_i$ : the set of actual auction durations under configuration  $s_i$ .

3 SOLUTION

**4 EXPERIMENTS**

5 CONCLUSION

## Experimental Settings: Comparison Methods

- **To evaluate auction duration prediction performance, we compare:**
  - Our method (ADAPT).

## Experimental Settings: Comparison Methods

- **To evaluate auction duration prediction performance, we compare:**
  - Our method (ADAPT).
  - Game theory models (GT1, GT2, GT3).
  - Machine learning-only method (EMB+MDN).

## Experimental Settings: Comparison Methods

- **To evaluate auction duration prediction performance, we compare:**
  - Our method (ADAPT).
  - Game theory models (GT1, GT2, GT3).
  - Machine learning-only method (EMB+MDN).
  - Other combinations of game theory and machine learning (GT1+MDN, GT2+MDN, GT1+EMB+MDN, GT2+EMB+MDN, GT1+GT2+MDN).

## Experimental Settings: Comparison Methods

- **To evaluate auction duration prediction performance, we compare:**
  - Our method (ADAPT).
  - Game theory models (GT1, GT2, GT3).
  - Machine learning-only method (EMB+MDN).
  - Other combinations of game theory and machine learning (GT1+MDN, GT2+MDN, GT1+EMB+MDN, GT2+EMB+MDN, GT1+GT2+MDN).
    - $ADAPT = GT1 + GT2 + EMD + MDN$ .

## Experimental Settings: Datasets

- **Synthetic dataset:** 1, 276 auction configurations.
- **Real dataset:** 115, 831 records, 1, 276 auction configurations.
  - Collected by [Byers et al. \(2010\)](#); [Augenblick \(2016\)](#) from online penny auction websites.

## Results: Auction Duration Prediction

- **Data:** Synthetic testing data (10% of all synthetic data).
- **Metric:** NLL averaged over 8 runs.

## Results: Auction Duration Prediction

- **Data:** Real testing data (10% of all real data).
- **Metric:** NLL averaged over 8 runs.

# Results: Auction Duration Prediction

- Example in real testing data:
  - **Histogram**: Actual auction duration (normalized).
  - **ADAPT**: Prediction with the lowest NLL.

# Results: Prediction Under Large Domain Shifts

# Results: Prediction Under Large Domain Shifts

- Split by bid fee:
  - Real testing data: auctions with the bid fee of 0.01.
  - Real training & validation data: the remaining.

# Results: Prediction Under Large Domain Shifts

- Split by bid fee:

- Real testing data: auctions with the bid fee of 0.01.
- Real training & validation data: the remaining.

1 BACKGROUND

2 PROBLEM

3 SOLUTION

4 EXPERIMENTS

5 CONCLUSION

# Contribution

- Design a framework to predict the auction duration under different auction configurations.

# Contribution

- Design a framework to predict the auction duration under different auction configurations.
- Propose a approach to predict strategic behavior combining the strengths of game theory and machine learning.
